The General Setting

Block Ciphers and Security Notion

Definition: Block Cipher

- $E : \mathcal{K} \times \mathcal{M} \rightarrow \mathcal{C}$ family of permutations, with \mathcal{K} the key space, \mathcal{M} the message space, and \mathcal{C} the cipher space
- In practice: $\mathcal{K} = \mathbb{F}_2^s$ and $\mathcal{M} = \mathcal{C} = \mathbb{F}_2^n$.
 $E_k = E(k, \cdot)$ the *encryption* under key k ,
 $D_k = E_k^{-1}$ the *decryption*,
 s the *key length* and n the *block length*.

Further let $\text{Perm}_n = \{f : \mathbb{F}_2^n \rightarrow \mathbb{F}_2^n \mid f \text{ is permutation}\}$ the set of n -bit permutations.

Definition: Security

A block cipher E is (q, t, ε) -secure, if the (CPA)-advantage of every (q, t) -adversary is bound by ε :

$$\text{Adv}_E^{\text{PRP-CPA}}(\mathcal{A}_{q,t}) := \left| \Pr_{k \in_R \mathbb{F}_2^s} [\mathcal{A}_{q,t}^{E_k} = 1] - \Pr_{f \in_R \text{Perm}_n} [\mathcal{A}_{q,t}^f = 1] \right| \leq \varepsilon .$$

In practice: security of a block cipher always security against known attacks.

In practice: security of a block cipher always security against known attacks.

Substitution Permutation Networks

The most common design structure for block ciphers

Exemplary SPN Structure

- S-box $S : \mathbb{F}_2^n \rightarrow \mathbb{F}_2^n$ provides *confusion* and non-linearity on small blocks (typically $3 \leq n \leq 8$)
- Linear layer $P : \mathbb{F}_2^{tn} \rightarrow \mathbb{F}_2^{tn}$ provides *diffusion* and spreads the S-box influence over the whole state
- Key-alternating: the round keys are added in between the rounds

The Problem/Our Goal

Find a solution to

Problem: Security against Subspace Trails

Given an SPN with round function F , consisting of

- t parallel applications of an S-box $S : \mathbb{F}_2^n \rightarrow \mathbb{F}_2^n$ and
- a linear layer $L : \mathbb{F}_2^{tn} \rightarrow \mathbb{F}_2^{tn}$.

Compute an upper bound on the length of any subspace trail through the cipher.

Subspace Propagation

Given a starting subspace U , we can efficiently compute the corresponding longest subspace trail.

Lemma 1

Let $U \xrightarrow{F} V$ be a subspace trail. Then

$$\forall u \in U, x \in \mathbb{F}_2^m : \Delta_u(F)(x) := F(x) + F(x+u) \in V.$$

This implies $\text{Span} \left\{ \bigcup_{u \in U} \text{Im } \Delta_u(F) \right\} \subseteq V$.

Computing the subspace trail

- To compute the next subspace, we have to compute the image of the derivatives.

Proof

Security Arguments and Tool-based Design of Block Ciphers

Propagating Subspaces

Subspace Propagation

Subspace Propagation

Given a starting subspace U , we can efficiently compute the corresponding longest subspace trail.

Lemma 1

Let $U \xrightarrow{F} V$ be a subspace trail. Then

$$\forall u \in U, x \in \mathbb{F}_2^m : \Delta_u(F)(x) := F(x) + F(x+u) \in V.$$

This implies $\text{Span} \left\{ \bigcup_{u \in U} \text{Im } \Delta_u(F) \right\} \subseteq V$.

Computing the subspace trail

- To compute the next subspace, we have to compute the image of the derivatives.

Proof

Propagate a Basis

Actually it is enough to compute only the image of the derivatives in direction of U's basis vectors.

Lemma 2

Given $U \subseteq \mathbb{F}_2^m$ with basis $\{b_1, \dots, b_k\}$. Then $\text{Span} \left\{ \bigcup_{u \in U} \text{Im } \Delta_u(F) \right\} = \text{Span} \left\{ \bigcup_{b_i} \text{Im } \Delta_{b_i}(F) \right\}$.

Proof: \supseteq trivial, \subseteq by induction over the dimension k of U

Let $u = \sum_{i=1}^k \lambda_i b_i$ and $v \in \text{Im } \Delta_u(F)$, i. e. there exists an x s. t.

$$v = F(x) + F(x + \sum_{i=1}^k \lambda_i b_i) = F(y + \lambda_k b_k) + F(y + \sum_{i=1}^{k-1} \lambda_i b_i) = \lambda_k \Delta_{b_k}(F)(y) + \Delta_{u'}(F)(y).$$

Thus $v \in \text{Span} \left\{ \text{Im } \Delta_{b_k}(F) \cup \text{Im } \Delta_{u'}(F) \right\}$, where u' is contained in a $(k-1)$ dimensional subspace. \square

Security Arguments and Tool-based Design of Block Ciphers

Propagating Subspaces

Propagate a Basis

Propagate a Basis

Actually it is enough to compute only the image of the derivatives in direction of U's basis vectors.

Lemma 2
Given $U \subseteq \mathbb{F}_2^m$ with basis $\{b_1, \dots, b_k\}$. Then $\text{Span} \left\{ \bigcup_{u \in U} \text{Im } \Delta_u(F) \right\} = \text{Span} \left\{ \bigcup_{b_i} \text{Im } \Delta_{b_i}(F) \right\}$.

Proof: \supseteq trivial, \subseteq by induction over the dimension k of U
Let $u = \sum_{i=1}^k \lambda_i b_i$ and $v \in \text{Im } \Delta_u(F)$, i. e. there exists an x s. t.

$$v = F(x) + F(x + \sum_{i=1}^k \lambda_i b_i) = F(y + \lambda_k b_k) + F(y + \sum_{i=1}^{k-1} \lambda_i b_i) = \lambda_k \Delta_{b_k}(F)(y) + \Delta_{u'}(F)(y).$$

Thus $v \in \text{Span} \left\{ \text{Im } \Delta_{b_k}(F) \cup \text{Im } \Delta_{u'}(F) \right\}$, where u' is contained in a $(k-1)$ dimensional subspace. \square

$$v = F(x) + F(x + \sum_{i=1}^k \lambda_i b_i)$$

substitute $x + \lambda_k b_k = y$

$$= F(y + \lambda_k b_k) + F(y + \sum_{i=1}^{k-1} \lambda_i b_i)$$

add $0 = F(y) + F(y)$ and rewrite as derivatives, with $u' = \sum_{i=1}^{k-1} \lambda_i b_i$

$$= \Delta_{\lambda_k b_k}(F)(y) + \Delta_{u'}(F)(y)$$

as λ_k is zero/one valued

$$= \lambda_k \Delta_{b_k}(F)(y) + \Delta_{u'}(F)(y)$$

ComputeTrail Algorithm

Computation of Subspace Trails

Input: A nonlinear function $F : \mathbb{F}_2^m \rightarrow \mathbb{F}_2^m$, a subspace U .

Output: A subspace trail $U \xrightarrow{F} \dots \xrightarrow{F} V$.

```

1 function ComputeTrail(F, U)
2   if dim U = m then return U
3   V ← ∅
4   for  $u_i$  basis vectors of U do
5     for enough  $x \in_{\mathbb{R}} \mathbb{F}_2^m$  do
6        $V \leftarrow V \cup \{\Delta_{u_i}(F)(x)\}$ 
7   V ← Span{V}
8   return  $U \xrightarrow{F}$  ComputeTrail(F, V)
```

Remaining Problem: cyclic STs

Correctness: previous two lemmata

Runtime:

- Line 4: $\mathcal{O}(m)$ iterations
- Line 5: $\mathcal{O}(m)$ random vectors are enough
- Recursions: can stop after $\mathcal{O}(m)$ rounds
- Overall: $\mathcal{O}(m^3)$ evaluations of F

Security Arguments and Tool-based Design of Block Ciphers

Propagating Subspaces

ComputeTrail Algorithm

2019-12-07

ComputeTrail Algorithm

2   if dim U = m then return U
3   V ← ∅
4   for  $u_i$  basis vectors of U do
5     for enough  $x \in_{\mathbb{R}} \mathbb{F}_2^m$  do
6        $V \leftarrow V \cup \{\Delta_{u_i}(F)(x)\}$ 
7   V ← Span{V}
8   return  $U \xrightarrow{F}$  ComputeTrail(F, V)
```

Remaining Problem: cyclic STs

Correctness: previous two lemmata

Runtime:

- Line 4: $\mathcal{O}(m)$ iterations
- Line 5: $\mathcal{O}(m)$ random vectors are enough
- Recursions: can stop after $\mathcal{O}(m)$ rounds
- Overall: $\mathcal{O}(m^3)$ evaluations of F

How many random vectors are enough:

<https://math.stackexchange.com/questions/564603/probability-that-a-random-binary-matrix-will-have-full-column-rank>

Draw n random vectors of length m , but because $n > m$ look at the probability

$\Pr[m \text{ vectors of length } n \text{ have rank } m] = \Pr[m \text{ vectors on length } n \text{ are linearly independent}]$.

The uniformly at random drawn $i + 1$ -th vector is linearly independent of the previous i vectors with probability

$$\frac{2^n - 2^i}{2^n} = 1 - 2^{i-n}$$

and thus for all vectors up to m we get the probability

$$\prod_{i=0}^{m-1} (1 - 2^{i-n}).$$

How to Bound the Length of Subspace Trails

Goal

Give an upper bound on the length of any subspace trail.

Naïve Approach 1

$\forall U \subseteq \mathbb{F}_2^m$ run `ComputeTrail(F, U)`

Naïve Approach 2

$\forall u \in \mathbb{F}_2^m \setminus \{0\}$ run `ComputeTrail(F, Span{u})`

Problem

Exp. many ($\mathcal{O}(2^{(m^2)})$) starting subspaces.

Problem

Still $2^m - 1$ starting subspaces.

Often used heuristic

Activate single S-boxes only. That is, for a round function with t S-boxes which are n -bit wide, choose $U = \{0\}^{i-1} \times V \times \{0\}^{t-i}$, where $V \subseteq \mathbb{F}_2^n$.

Security Arguments and Tool-based Design of Block Ciphers

Security for SPNs against Subspace Trail Attacks

How to Bound the Length of Subspace Trails

How many subspaces of \mathbb{F}_2^n :

<https://math.stackexchange.com/questions/70801/how-many-k-dimensional-subspaces-there-are-in-n-dimensional-vector-space-over>

$$\sum_{r=1}^n \frac{A(n, r)}{B(n, r)} = \sum_{r=1}^n \frac{\prod_{i=1}^r (1 - 2^{n-i+1})}{\prod_{i=1}^r (1 - 2^i)} = \sum_{r=1}^n \binom{n}{r}_2$$

$A(n, r)$: Number of subsets with r linear independent elements:

$$A(n, r) = \underbrace{(2^n - 1)}_{\text{choices for first element}} \overbrace{(2^n - 2)}^{\text{choices for second element}} \cdots \underbrace{(2^n - 2^{r-1})}_{\text{choices for } r\text{-th element}}$$

$B(n, r)$: Number of bases for one r -dimensional subspace:

$$B(n, r) = \underbrace{(2^r - 1)}_{\text{choices for first basis vector}} \overbrace{(2^r - 2)}^{\text{choices for second basis vector}} \cdots \underbrace{(2^r - 2^{r-1})}_{\text{choices for } r\text{-th vector}}$$

How to Bound the Length of Subspace Trails

Goal
Give an upper bound on the length of any subspace trail.

Naïve Approach 1
 $\forall U \subseteq \mathbb{F}_2^m$ run `ComputeTrail(F, U)`

Naïve Approach 2
 $\forall u \in \mathbb{F}_2^m \setminus \{0\}$ run `ComputeTrail(F, Span{u})`

Problem	Problem
Exp. many ($\mathcal{O}(2^{(m^2)})$) starting subspaces.	Still $2^m - 1$ starting subspaces.

Often used heuristic
Activate single S-boxes only. That is, for a round function with t S-boxes which are n -bit wide, choose $U = \{0\}^{i-1} \times V \times \{0\}^{t-i}$, where $V \subseteq \mathbb{F}_2^n$.

Activating a single S-box only

Problem

Heuristic not valid in general when we want to prove a bound on the subspace trail length. In particular one can construct examples where the best subspace trail does activate more than one S-box in the beginning.

The good case

However, we will see next a sufficient condition for the case when the heuristic is valid.

Problem

Heuristic not valid in general when we want to prove a bound on the subspace trail length. In particular one can construct examples where the best subspace trail does activate more than one S-box in the beginning.

The good case

However, we will see next a sufficient condition for the case when the heuristic is valid.

The Connection to Linear Structures

Let us observe how a single S-box S behaves regarding subspace trails:

Given a subspace trail $U \xrightarrow{S} V$, this implies

$$\Delta_u(S)(x) \in V \quad \text{for all } x \in \mathbb{F}_2^n \text{ and } u \in U.$$

By definition of the dual space V^\perp :

$$\langle \alpha, \Delta_u(S)(x) \rangle = 0 \quad \text{for all } \alpha \in V^\perp,$$

which are exactly the *linear structures* of S :

$$\text{LS}(S) := \{(\alpha, u) \mid \langle \alpha, \Delta_u(S)(x) \rangle \text{ is constant for all } x\}$$

The Connection to Linear Structures

Let us observe how a single S-box S behaves regarding subspace trails:

Given a subspace trail $U \xrightarrow{S} V$, this implies

$$\Delta_u(S)(x) \in V \quad \text{for all } x \in \mathbb{F}_2^n \text{ and } u \in U.$$

By definition of the dual space V^\perp :

$$\langle \alpha, \Delta_u(S)(x) \rangle = 0 \quad \text{for all } \alpha \in V^\perp,$$

which are exactly the linear structures of S :

$$\text{LS}(S) := \{(\alpha, u) \mid \langle \alpha, \Delta_u(S)(x) \rangle \text{ is constant for all } x\}$$

Theorem 3

$$U = V = U_1 \times \cdots \times U_t,$$

with $U_i \in \{\{0\}, \mathbb{F}_2^n\}$.

Proof

$$\text{For all } \alpha = (\alpha_1, \dots, \alpha_t) \in V^\perp: \quad \langle \alpha, \Delta_u(F)(x) \rangle = \sum_{i=1}^t \langle \alpha_i, \Delta_{u_i}(S)(x_i) \rangle = 0$$

Thus every term is constant and in particular, as S has no non-trivial LS, α_i or u_i is zero. If one of the two is zero, the other can take all values.

☐

- Security Arguments and Tool-based Design of Block Ciphers
 - Security for SPNs against Subspace Trail Attacks

- S-boxes without Linear Structures

S-boxes without Linear Structures

THE UNIVERSITY OF CHICAGO

Theorem 3

Let P be an S-box layer of t parallel S-boxes $S_1, \dots, S_t: \mathbb{F}_2^n \rightarrow \mathbb{F}_2^n$. If S has no non-trivial linear structures, then for every subspace trail $U \rightarrow U'$:

$$U' = V = U_1 \times \dots \times U_t,$$

with $U_i \subseteq \{0, 1\}^n$.

Proof

For all $\alpha = (\alpha_1, \dots, \alpha_t) \in V^\perp$:

$$\langle \alpha, \Delta_S(f(x)) \rangle = \sum_{i=1}^t \langle \alpha_i, \Delta_{S_i}(S_i(x_i)) \rangle = 0$$

This every term is constant and in particular, α_i has no non-trivial LS, α_i or α_i is zero. If one of the two is zero, the other can take all values.

S-boxes without Linear Structures

Resistance of SPN against Subspace Trails, without linear structures

The length ℓ of any subspace trail is upper bounded by

$$\ell \leq \max_{U \in \{\{0\}, \mathbb{F}_2^n\}^t} |\text{ComputeTrail}(F, U)|,$$

which needs 2^t evaluations of the `ComputeTrail` algorithm.

2019-12-07

Security Arguments and Tool-based Design of Block Ciphers

Security for SPNs against Subspace Trail Attacks

S-boxes without Linear Structures

S-boxes with Linear Structures

Compared to the no-linear-structures-case, V^\perp can now contain much more elements, namely all combinations of linear structures, such that their corresponding constants sum to zero.

Instead, we can show that (for any not-trivially-insecure S-box) the subspace after the first S-box layer contains at least one element of a specific structure:

$$W_{i,\alpha} = \{0\}^{i-1} \times \{0, \alpha\} \times \{0\}^{t-i}.$$

Resistance of SPN against Subspace Trails, with linear structures

The length ℓ of any subspace trail is upper bounded by

$$\ell \leq \max_{W_{i,\alpha}} |\text{ComputeTrail}(F', W_{i,\alpha})| + 1,$$

which needs $t \cdot 2^n$ evaluations of the `ComputeTrail` algorithm.

Note: F' first applies the linear layer, then the S-box layer (b/c of the skipped first S-box layer).
